@articleortiz2001, abstract = We investigate the simulation of fermionic systems on a quantum computer. We show in detail how quantum computers avoid the dynamical sign problem present in classical simulations of these systems, therefore reducing a problem believed to be of exponential complexity into one of polynomial complexity. The key to our demonstration is the spin-particle connection (or generalized Jordan-Wigner transformation) that allows exact algebraic invertible mappings of operators with different statistical properties. We give an explicit implementation of a simple problem using a quantum computer based on standard qubits. 2001 The American Physical Society., archivePrefix = arXiv, arxivId = cond-mat/0012334, author = Ortiz, G. and Gubernatis, J. E. and Knill, E. and Laflamme, R., doi = 10.1103/PhysRevA.64.022319, eprint = 0012334, issn = 1050-2947, journal = Physical Review A, month = jul, number = 2, pages = 022319, primaryClass = cond-mat, title = Quantum algorithms for fermionic simulations, url = <https://link.aps.org/doi/10.1103/PhysRevA.64.022319>, volume = 64, year = 2001
